End-to-End Supply Chain Ticketing Platform (Jira)

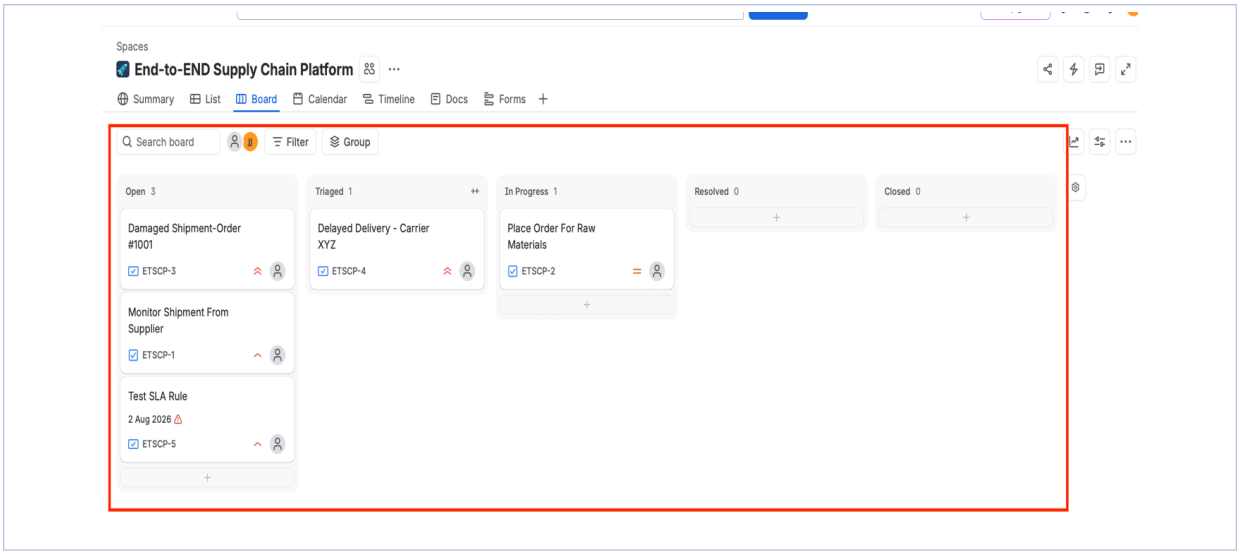

A supply chain issue-tracking system built in Jira to practise **project controlling, workflow design and process automation**. It combines a custom Kanban workflow, structured tracking fields, automation rules and a KPI dashboard, simulating how an operations team would log, escalate and report on supply chain issues from report to resolution.

Jira space: End-to-END Supply Chain Platform (key: ETSCP). **Tools:** Jira (team-managed software space), Jira Automation, Jira Dashboards

1. Custom workflow (Kanban board)

A 5-stage workflow that mirrors how a supply chain issue moves from report to resolution.

Open → Triaged → In Progress → Resolved → Closed

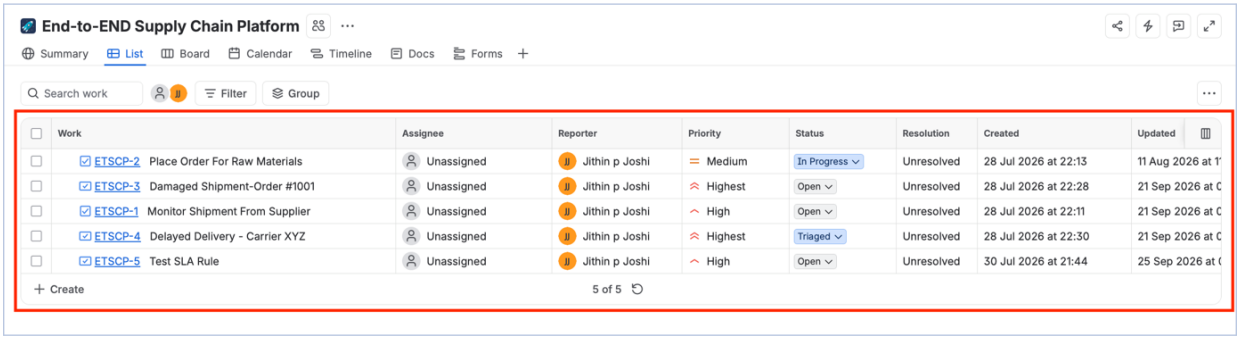

Kanban board: Open, Triaged, In Progress, Resolved, Closed

2. Sample issues

Five sample tickets cover typical supply chain events: supplier monitoring, raw material orders, damaged shipments and carrier delays. Each has a priority (Medium to Highest) and moves through the workflow above.

Key	Summary	Priority
ETSCP-1	Monitor Shipment From Supplier	High
ETSCP-2	Place Order For Raw Materials	Medium
ETSCP-3	Damaged Shipment - Order #1001	Highest
ETSCP-4	Delayed Delivery - Carrier XYZ	Highest
ETSCP-5	Test SLA Rule	High

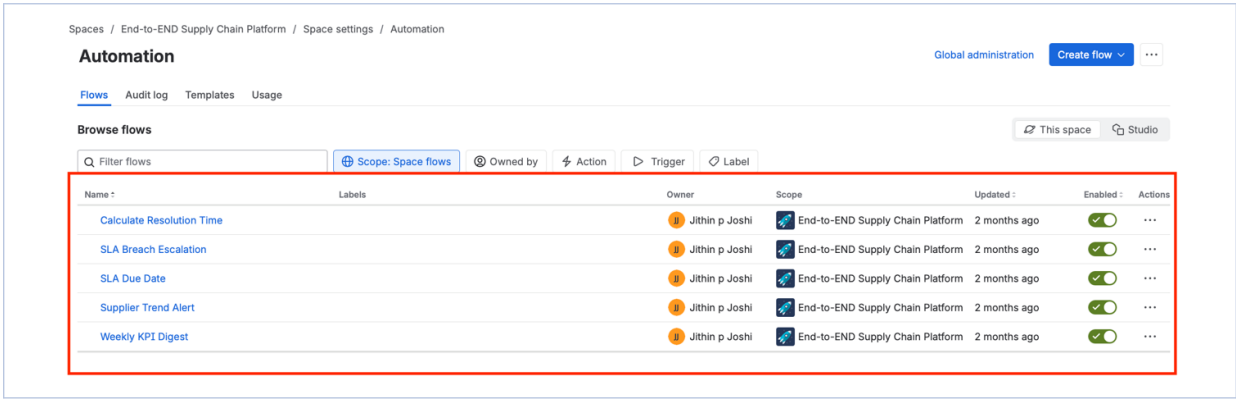

List view: work, assignee, reporter, priority, status, resolution, created and updated

3. Automation rules

Five rules remove manual work and enforce SLAs:

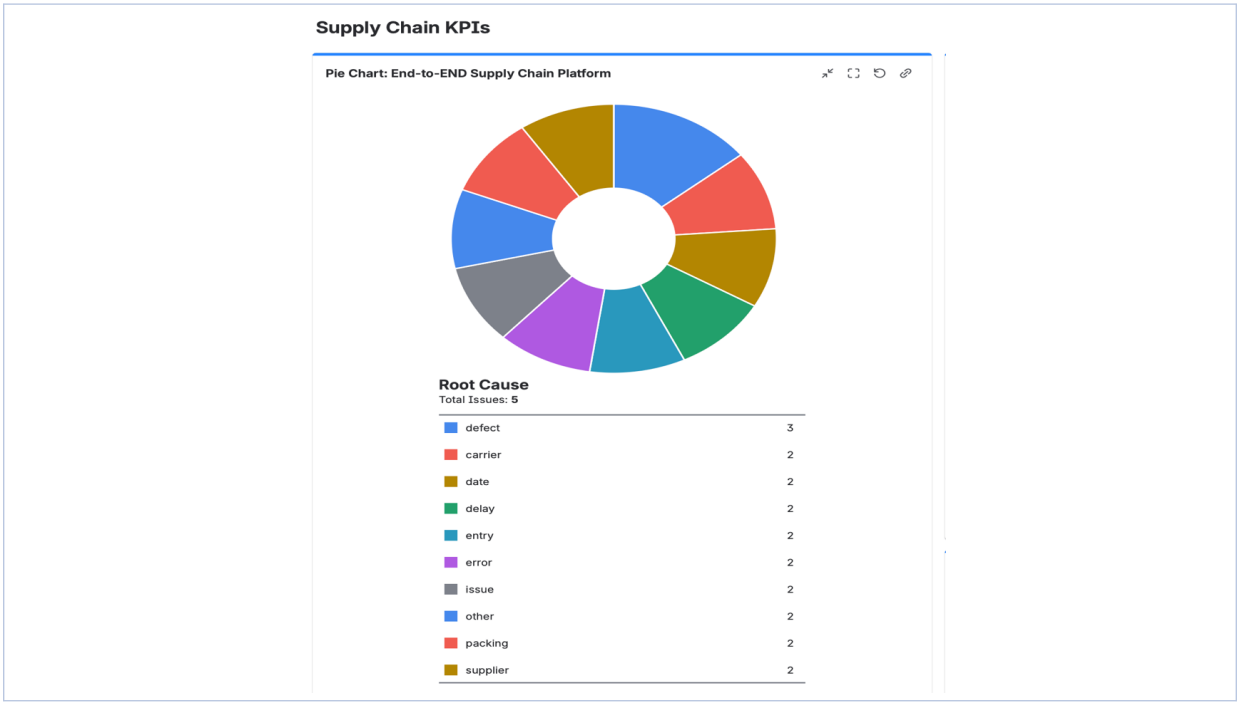

Rule	Purpose	Status
SLA Due Date	Automatically sets a due date when an issue is created	Enabled
SLA Breach Escalation	Escalates issues that pass their due date	Enabled
Calculate Resolution Time	Records how long an issue took to resolve	Enabled
Supplier Trend Alert	Flags repeated problems linked to the same supplier	Enabled
Weekly KPI Digest	Emails a weekly summary of issue health	Enabled

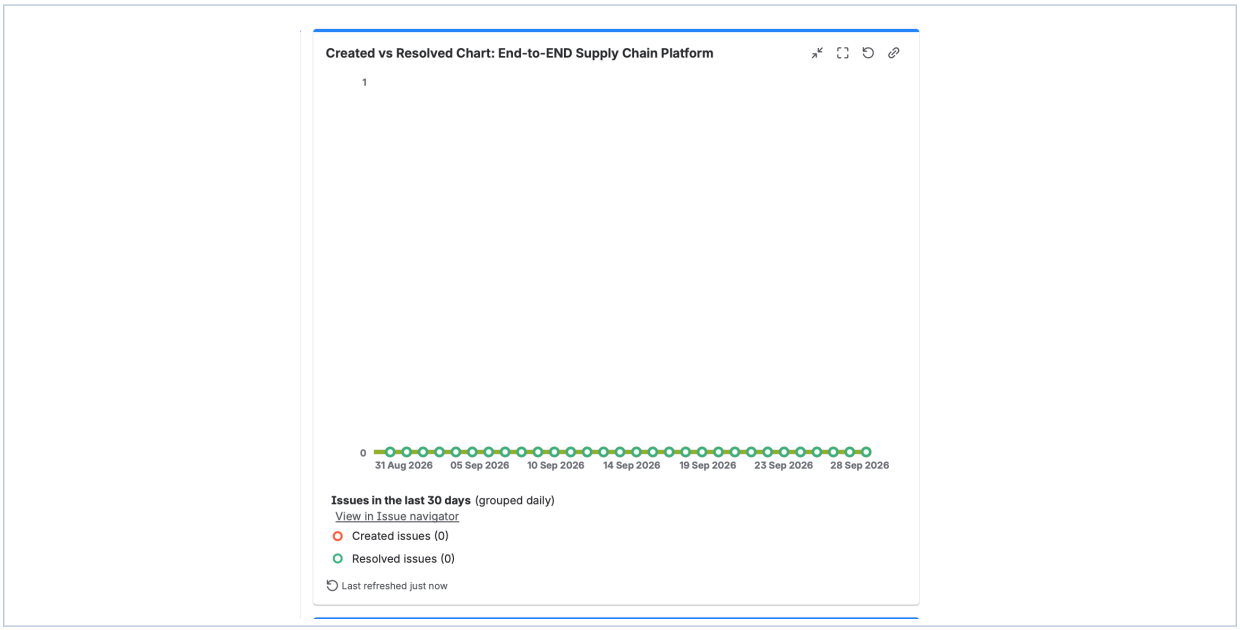

Automation rules in the space: all 5 flows owned and enabled

4. KPI dashboard

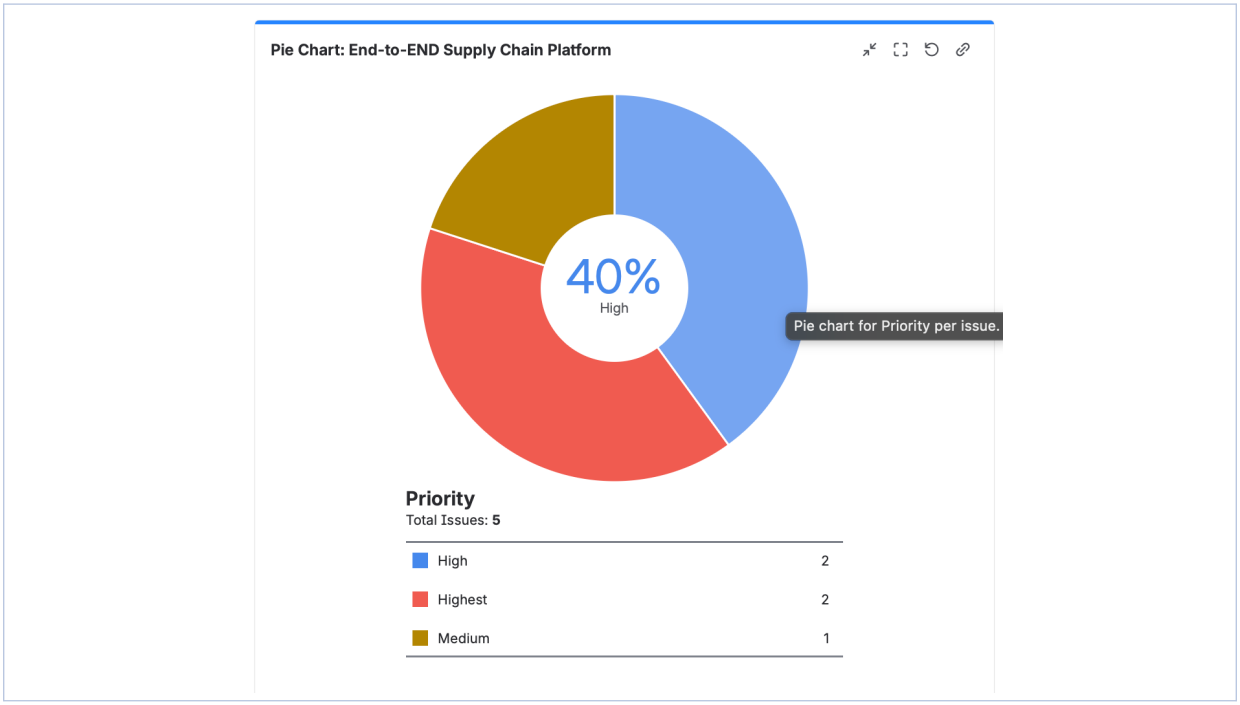

The **Supply Chain KPIs** dashboard gives a live view of issue health: Root Cause breakdown, Created vs Resolved trend, Priority distribution and Average Age.

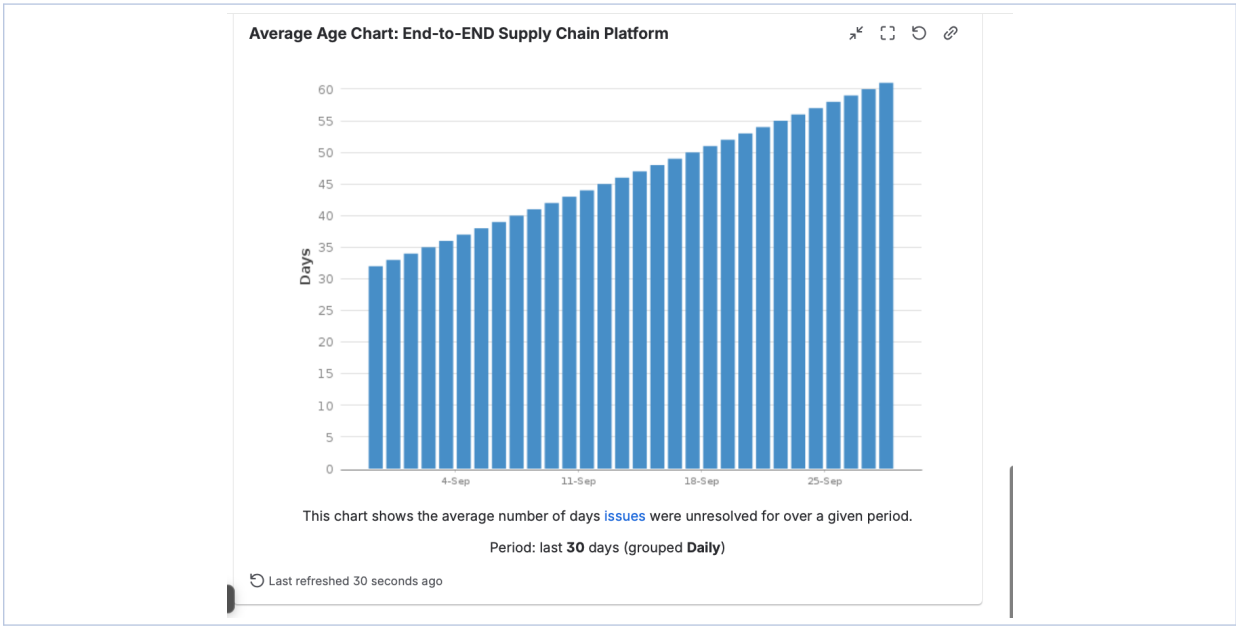

Root Cause breakdown (pie chart)

Created vs Resolved chart (last 30 days)

Priority distribution (pie chart)

Average Age chart (last 30 days)

What this project demonstrates

- Workflow design that matches a real operational process
- Custom fields for root cause and priority tracking
- Rule-based automation for SLAs, escalation and reporting
- KPI reporting with dashboards and scheduled email digests
